ABSTRACT

PROBLEM TO BE SOLVED: To judge quality of a die **model** formed on the basis
of CAD data.

SOLUTION: **Product** shape data formed by assuming **product** shape after
working. is input (S1), working dimension data when working is added to the
product shape data (S2), and a **work** shape **model** is formed on the
basis of the **product** shape data (S3). The **product** shape data is input
in a separate place (S4), and working pass data containing a tool track
when working products is added to the **product** shape data (S5), and a
working pass shape **model** is formed on the basis of the **product** shape
data (S6). The **work** shape **model** and the working pass shape **model** are
overlapped with each other to device whether dimension of a working part of
the **work** shape **model** exists within a regulation range or not (S7 and
S8), and whether dynamic balance of the formed parts shape **model** exists
with the regulation range or not is decided (S9 and S10). When both the
dimension of the working part and the dynamic balance exist within the
regulation range, a die **model** for forming **product** shape before working
is formed on the basis of the **work** shape **model** (S11).
